

*Topic: Web-based application for kids, adolescents and adults with autism and their tutors.*

*Author: Darielis M. Morales Rodríguez*

*Date: January 20, 2021*

*Problem Background:*

- *Currently the autism community has many problems receiving most of the services because the world is not prepared to serve them in the way that this community needs, to feel part of the whole society, feel comfortable and safe. Although there are certain specialized places to serve this community efficiently, many of the people who have this condition do not know about these places since there is no place that promotes these places, and they can be aware of these places and the services that are offering.*

*Countermeasures:*

- *Make a web-based application in which people can find the required but specialized service for the autism community.*

*Target:*

- *The autism community and their tutors.*
- *That they can efficiently obtain specialized services.*

*Check/Evaluate:*

- *Feedback from users, corroborate the information and the validity of the services in the places.*

*Causes:*

- *Society has taken the right to put this community aside and the world is not prepared to serve in the way that this community deserves to be comfortable, safe and feel part of the whole society.*

*Act/Standardize:*

- *Set the necessary permissions to administrate, maintain and edit the web application.*
- *Update the web application every so often to keep services up to date.*
